

## UC Solution Packages

# Microsoft Exchange 2007 Unified Messaging

Wouldn't it be great if you could access your Exchange data wherever you are? Now you can, using NEC Philips Unified Messaging integration solution for Microsoft Exchange 2007.

*NEC Philips provides integration between your legacy or IP telephone system and Exchange 2007 resulting in a true Unified Messaging environment.*

In this UM environment, users save time as all messages (email, voicemail and fax) are centralized in a single inbox.

A great new feature is that users may access Exchange from any phone, giving worldwide access to Exchange data, increasing user productivity and flexibility. In addition, Exchange Unified Messaging adds Outlook Voice Access providing users the ability to manage not just voicemail, but email messages & calendar items. For example, users may listen to and reply to emails, check, accept, or clear calendar appointments over the phone.

## Exchange 2007 Unified Messaging

### Integrating Communications

Microsoft Exchange Server 2007 breaks down the traditional walls between disjointed messaging systems. Exchange Unified Messaging offers advancement in the way we communicate and collaborate. Communications become truly integrated.

While traditional communications systems delivered messages into several different types of storage—voicemail systems, e-mail servers, and stand-alone fax machines—with Exchange Unified Messaging all types of messages are stored in one system. Voicemail messages, for example, are delivered directly into your inbox. You see them right beside your e-mail when you open up Outlook, offering powerful new ways to collaborate more effectively. For example, you can forward a voicemail or fax. You can even take notes in your voicemail message or search for old voicemail messages. Unified Messaging combines voice messaging, fax, and e-mail messaging into one store, accessible from a telephone and a computer.

NEC Philips integrates Microsoft Exchange 2007 Unified Messaging with your existing telephony network and brings the Unified Messaging features to the core of Exchange Server.

Exchange Unified Messaging offers five key benefits for your organisation:

- ◆ **Information worker productivity.** No matter where the workers are and what form the information is in, they can quickly find, send, and receive the exact information they need.
- ◆ **Single storage for all information types.** Exchange 2007 seamlessly delivers e-mail, voice mail, calendar data and fax messages into users' inboxes. Users can sort, manage, and act on multiple message types without having to switch between applications or systems.
- ◆ **Access Anywhere.** Exchange Unified Messaging delivers access from familiar clients like Microsoft Office Outlook and Outlook Web Access, while Outlook Voice Access offers access to messages over a variety of mobile devices and ordinary telephones. For example, if you're stuck in traffic on the way to a meeting you can quickly reschedule the meeting and Outlook will inform all the meeting attendees of the change for you. You can also have your emails read to you and respond and delete email messages in a hands free environment using speech recognition.
- ◆ **Reduced costs.** Integrated Unified Messaging systems reduce the number of server needed to provide voice mail and fax service. Server consolidation can dramatically lower maintenance costs (e.g. by having single point of management), particularly for organisations with remote or branch offices.
- ◆ **Foundation for Unified Communications.** The combination of e-mail, voice mail and fax capability can be augmented with presence, instant messaging (IM) and real-time conferencing using Microsoft Office Communications Server 2007 to expand the ways users can communicate.

NEC Philips is a member of Microsoft's Unified Messaging Specialists team to provide technical installation & professional services for deployments of Exchange 2007 Unified Messaging.

NEC Philips offers advanced IP-based solutions that unify products, applications and services, enabling organizations to communicate and collaborate more effectively, efficiently and reliably.
